

Home Screen Redesign PRD

Tap Tap Send — Native Mobile App

Status: Draft | **Last Updated:** June 2026

Overview

This spec covers a redesign of the Tap Tap Send home screen. The goal is not to introduce net-new features but to reorganize and elevate existing functionality: improving information hierarchy, surfacing value more clearly, making key actions more accessible, and raising the overall visual quality of the experience.

Goals

- Make sending money faster and more prominent
 - Communicate exchange rate quality at a glance
 - Unify the wallet and card concepts into a single, coherent component
 - Improve bill pay discoverability and clarity
 - Introduce gamification that reinforces the emotional value of supporting family
 - Elevate visual design to feel more sophisticated and personalized
 - Remove redundant components (Activity section, Apple Pay tout, microphone CTA)
 - Add light micro-animations throughout for a polished, satisfying feel
-

Non-Goals

- No net-new features

- No changes to tab navigation structure (with the exception of renaming "Cards" to "Wallet")
 - No changes to the underlying transfer or bill pay flows
-

Success Metrics

- Increase in home screen → Send Money funnel completion rate
 - Decrease in drop-off on incomplete transfers (resume CTA effectiveness)
 - Increase in wallet activation rate (users with no card who set one up) and home screen wallet interaction rate (taps leading to a wallet action or the Wallet tab)
 - Increase in rate badge impressions correlating with same-session transfer starts
 - Increase in Bill Pay setup initiated from home screen
 - Qualitative improvement in perceived quality/trust (user research / usability testing)
-

Component Breakdown

1. Header

Behavior:

- Personalized greeting at the top of the screen: "Hi [First Name]"
- Notification bell or settings icon in the top-right corner

Design notes:

- Serif typeface for the greeting; establishes a warm, editorial tone
 - Should feel personal, not generic
-

2. Send Money

This is the primary action on the screen and should be treated as such visually.

Behavior:

- Two pre-filled input fields (send amount / receive amount) defaulting to the user's most commonly sent amount, with the live exchange rate reflected in real time
- Exchange rate badge: contextual label such as "Lowest rate in 14 days" — shown only when the current rate is the best Tap Tap Send has offered on that corridor within a rolling time window; badge animates in with a shimmer effect when scrolling into view
- Incomplete transfer callout: if the user abandoned a transfer mid-flow, show a dismissible callout with a CTA to resume ("Continue your transfer →")
- Smart suggestion: if an upcoming pay cycle is detected (based on past behavior), pre-fill a suggested amount, date, and recipient with a prompt to confirm or schedule
- "Set up a recurring transfer" CTA for users who haven't yet set up scheduled payments
- "See all transfers" link navigates to the Activity tab (replaces the standalone Activity section)

Design notes:

- Primary "Send" button uses the primary brand color — this is the only button on the screen that should
 - Remove the microphone icon next to the Send button
 - Serif header ("Send Money"); sans-serif for labels and CTAs
-

3. Wallet & Cards

Behavior:

- Displays a mini virtual card visual as the primary UI element; swipeable if multiple cards/wallets exist, though the UI should not over-index on the multi-card case (most users have one)
- Shows total funds available across all wallets, consolidated and displayed in the user's home currency (e.g., GBP), converted at current exchange rates

- Quick actions tied to the card in view: Add Money, Convert, Send Money, Request Money
- "Manage Wallet" CTA navigates to the Cards tab (renamed "Wallet")
- Scan button (currently top-right of screen) moves into this component; tapping launches the QR code scanner/share sheet
- "Add to Apple Wallet" action accessible within this component
- Tapping a card navigates to the wallet detail screen

Design notes:

- Card visual should look like a real virtual card (card number masked, currency/flag, brand logo)
 - Swipe or flip animation between cards; flip animation could also be used to reveal card details
 - Money amount animates in with a counting-up effect on page load
 - Drop shadow behind the card for depth
 - Tap state on quick action buttons should use an inset/pressed treatment
-

4. Bill Pay

Behavior:

- Shows upcoming and past-due bills across all currencies/wallets, with due dates sourced from connected provider integrations. Bill Pay is decoupled from the send currency selector — bills display regardless of which send currency is currently selected.
- Each bill category card indicates whether an integration is set up (e.g., a connected badge or checkmark)
- Tapping a category card expands a drawer:
 - **If linked:** Shows the connected account name with a "Manage" link
 - **If not linked:** Moves the card to an inset/pressed state and expands a drawer showing a teaser of available partner integration options with a "See all partners" link

- "Manage Bills" CTA in the section header navigates to the full Bill Pay tab

Design notes:

- Section should feel like a teaser/summary, not the full bill pay experience
 - Category cards use cohesive, minimalistic icons (unique per category — no reuse of icons across different features)
 - Inset press state on card tap
-

5. Impact / Gamification

Behavior:

- Shows the user a running total of all money sent, with a breakdown by recipient
- Framed around the emotional value of what the user has contributed (e.g., "You've sent £4,200 this year")
- Animated counter effect on page load or when scrolling into view
- Data visualization (bar chart or timeline) showing sending patterns over time — a key opportunity for surprise and delight

Design notes:

- This component should feel celebratory and warm, not clinical
 - Serif section header
 - Animation should be subtle — a smooth count-up, not an aggressive flashy effect
-

6. Referrals

Replaces the current Apple Pay tout and moves to the bottom of the screen (last component before the tab bar).

Behavior:

- Card-style component showing the referral program CTA (invite a friend, earn a reward)

- Does not show "total earned" inline — that detail lives in the Activity tab as a documented transaction
- Tapping a details button flips or expands the card to show how the referral program works

Design notes:

- Flip card animation for showing program details
- Should not feel like an ad; tone should be friendly and understated
- Lower visual priority than the components above it

Removed Components

Component	Disposition
Activity section	Removed; replaced by "See all transfers" CTA in Send Money component
Apple Pay tout	Removed; Apple Wallet add action lives in the Wallet component
Microphone icon (Send)	Removed
Currency selector (Bill Pay tie-in)	Removed — Bill Pay now displays across all currencies regardless of the active send currency.

Visual Design Direction

Typography:

- Section headers: serif (e.g., a humanist serif like Playfair Display or equivalent)
- Body copy, labels, CTAs: sans-serif (existing brand typeface)

Color & Iconography:

- Monochrome or two-tone icon system; each icon must be unique to its function (no reuse across features)
- Primary button color reserved exclusively for the most important CTA on screen (Send Money)

- Secondary and tertiary actions use outlined or ghost button styles

Depth & Elevation:

- Light drop shadows on cards and component containers
- Inset/pressed tap state on buttons and tappable cards

Motion:

- Badge shimmer on scroll into view
 - Money counter animates up on load
 - Swipe/flip animation on card carousel
 - "Sent" confirmation animation: satisfying but not overdone — communicates success clearly
 - General page micro-animations to breathe life into the experience; nothing that adds latency or feels gimmicky
-
